Submitted (APR-2003) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one
specific adenosine on the 28S rRNA.
-!- SIMILARITY: Belongs to the ribosome-inactivating protein family.
EMBL; AJ487680; CAD32216.1; -.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               STRAIN=0157:H7 / RIMD 0509952 / EHEC;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

(XOMA ) XOMA CORP.

Analogues of type I ribosome inactivating protein - useful as cytotoxic agents, immuno toxins for treating auto immune diseases, cancer, graft versus host disease and selective cell killing in=vivo.

Example 10; Page 114; 163pp; English.

The invention covers analogues of the plant type I RIP gelonin which have a non-naturally occurring Cys residue in a position which enables the analogue to be conjugated via a disulphide linkage to a molecule which specifically binds to a target cell. Pref. target-cell binding molecules are antibodies or their fragments, esp. human engineered H65 antibody

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The Shiga toxin (Stx) peptides (AAWS8827-WS8830) were histine-tagged to simplify and expedite purification. Non toxic Shiga toxoids, Fusion proteins of Hist-tagged Shiga toxins/toxoids and antibodies can be used in the treatment, diagnosis or prevention of infections mediated by toxins of the Stx family. These are associated with haemorrhagic colitis and the
fragments. Fusion constructs were assembled that included a natural sequence gelonin gene fused to an H65 truncated heavy chain gene or an H65 Light chain (kappa) gene. A DNA linker encoding a peptide segment of the E.coli shiga-like toxin was inserted between the gelonin gene and the Ab gene. The resulting immunoconjugates can be used as cytotoxic therapeutic agents. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Purification and isolation of histidine-tagged Shiga toxins - useful in vaccines against haemorrhagic colitis and haemolytic uremic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                life-threatening sequela, haemolytic uremic syndrome. Shiga antibodies are also useful for the treatment, diagnosis and prevention of disease and infections by pathogenic Escherichia coli
                                                                                                                                                                                                                                                                                                                             Histine-tag; toxoid; antibody; treatment; diagnosis; prevention; Stx; haemorrhagic colitis; haemolytic uremic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

This is the Shiga-like toxin (SIT) subunit A amino acid sequence. SIT is a bacterial toxin related to the Shiga toxin (ShT). SIT and ShT have the smallest known B subunit of all AB toxins, and the A subunit has identical catalytic activity as the corresponding subunit in ricin. The B subunit amino acid sequences are used in the methods of the invention, which relates to the creation of a library of microorganism clones producing mutant proteins which are then screened for their ability to specifically bind to and kill carget cell. AAY3393-Y3389 and AAY43001-Y33024 are examples of mutant B subunit identified by the methods of the invention. The B subunit of the toxin has high binding specificity, and therefore mutant versions of the B subunit identified by the methods of the specific cell. Cytotoxic mutant proteins identified by the method can be used to identify therapeutic proteins and medicaments having binding specificity for a target cell. The cytotoxic mutants can also be used to construct diagnostic probes for detecting the presence of cell surface markers. These medicaments can be used to target medicines to target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

```
coli verotoxin (VT) can be used to treat intoxicated adults and children with enteric bacterial infections. They may also be used as prophylactics e.g. as a vaccine, against diarrhoeal disease or the development of extra-intestinal complications of 8 coli infection, especially haemolytic traemic syndrome. The antitoxin can also be used to detect 8. coli VT in a sample. The VT is recombinant, preferably a fusion protein containing a non-VT protein sequence and part of the 8 coli VTI or VT2 sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             pro-Ribosome Inactivating Protein, proRIP; peptide linker; cancer, inactivation; eukaryotic ribosome, alpha fragment; beta fragment; inhibitor; protein synthesis; N-glycosidase; glycosidic bond; liver; rat; ribosomal 28S RNA; cellular proliferation; HIV-infected T cell.
                                                                                                                                                                                                                                                                                                                                                 Compsn. contg. neutralising antitoxin against E.coli vero-toxin - used t
treat intoxicated individuals, and as a prophylactic against diarrhoeal
disease or extra-intestinal complications of E.coli infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Compositions containing neutralising antitoxin against one or more

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents an exemplary cell toxin, which can be incorporated into the conjugates of the invention. The specification describes a conjugate, comprising a targeted agent and a chemokine receptor ligand. The conjugate binds to a chemokine receptor resulting in internalisation of the targeted agent in cells bearing the receptor. The conjugates are used for formulating a medicament or for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  disorders associated with inflammatory responses resulting from activation; proliferation and migration of immune effector cells. The disorders or disease states comprise secondary tissue damage such as central nervous system (CNS) injury, CNS inflammatory diseases, neurodegenerative disorders, heart disease, inflammatory eye diseases, inflammatory bowel diseases, inflammatory joint diseases, inflammatory kidney or renal diseases, inflammatory lung diseases, inflammatory nasal diseases, inflammatory thyroid disease such as thyroiditis, or cytokineregulated cancers
                                           Chemokine receptor; ligand; inflammatory response; immune effector cell;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A new therapeutic agent comprising a conjugate for treating secondary tissue damage and other disease conditions like Alzheimer's disease, stroke, Parkinson's disease and atherosclerosis.
                                                             secondary tissue damage; central nervous system injury; shiga; CNS inflammatory disease; neurodegenerative disorder; heart disease; inflammatory bowel disease; PCR primer; inflammatory powel disease; inflammatory ioint disease; inflammatory kidney; renal disease; inflammatory iung disease; inflammatory nasal disease; inflammatory thyroid disease; cytokine-regulated cancer; se.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Verotoxin; Escherichia coli; enteric infection; diarrhoea; vaccine; haemolytic uraemic syndrome; detection.

```
which was engineered to contain a selectively removable internal peptide
which was engineered to contain a selectively removable internal peptide
thinker sequence separating the alpha and beta units of the RIP. When
separated the two units regain activity and are capable of inactivating
cukaryotic ribosomes and hence preventing protein production. Many
different RIPs may be produced with an internal linker including maize
and in the construction of therapeutic toxins targeted to
specific cells such as tumour cells via the attachment of a targeting
colypeptide, e.g. a monoclonal antibody. A further use is in HIV therapy
(see U5486903). There is interest in expressing RIP recombinantly in
chost eukaryotic cells, because of the capacity to provide correct post-
translational processing. However, RIPs effectively inhibit protein
synthesis in eukaryotic cells resulting in cell death. Since the inactive
RIP proteins are not cytotoxic to eukaryotic cells, they can be
recombinantly expressed in such cells and then converted to active RIP
                                                                                                             DNA encoding pro-ribosome inactivating proteins - inactive precursors of ribosome inactivating proteins; can be expressed in eukaryotic cells without causing cell death.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        VT-1; verotoxin; antitoxin therapy; fusion protein; affinity tag; food; recombinant production; screening; dairy; anti-bacterial; vaccine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                         The sequences given in AAW21698-710 represent Ribosome Inactivating Proteins (RIP's), which may be used in the construction of the proRIP of the invention. The proRIP has a selectively removable, internal peptide linker. The precursor sequence is incapable of inactivating eukaryotic ribosomes, but can be converted by removal of the linker into a protein carbosomes, but can be converted by removal of the linker into a protein carbosomes. RIPs are potent inhibitors of eukaryotic protein synthesis. They possess a highly specific N-glycosidase activity which cleaves the glycosidic bond of adenine 4324 of rat liver ribosomal 288 RNA. RIP's selectively inhibit cellular proliferation of cells, e.g. cancer cells and HIV-infected Toells. The inactive proRIP proteins make it possible to provide protein synthesis inhibitors with uses in practical and improved ways not before possible. The RIP can be used to make cytotoxic conjugates. Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

New recombinant expression vector encoding affinity tag and Escherichia coli type 1 or type 2 verotoxin, useful for treating or preventing

This invention relates to a recombinant expression vector encoding an affinity tag and protein comprising at least a portion of a bacterial coxin consisting of Escherichia coli type 1 or type 2 verocoxin. The expression vector can be used to produce recombinant verotoxin protein which can be used to create a vaccine against diseases caused by E. coli such as verotoxin haemorrhagic cystitis and balantitis. The antitoxins are useful for treating humans and animals intoxicated with a bacterial coxin, particularly E. coli verotoxin. The antitoxins may also be used in the preventative treatment and in diagnostic assays to detect the treatment and in diagnostic assays to detect the complex are useful as immunogens for the production of vaccines.

The prevence of a troxin in a sample. The polypeptides derived from E. coli cortoxins are useful as immunogens for the production of vaccines.

The prevence of a trisk of diarrhoeal disease or a trisk of developing extractine thrombotic thrombocytopenic purpura. The present sequence syndrome, thrombotic thrombocytopenic purpura. The present sequence represents the E.coli verotoxin protein VTI-A used to create the diseases due to E. coli verotoxins and in producing vaccines Example 6; Page 38-39; 98pp; English. expression vectors of the invention

Enterohemorragic Escherichia coli O157:H7-specific nucleic acid molecule and a polypeptide and its use, a polypeptide, a vector and a host cell. 

Claim 3; SEQ ID NO 590; 2067pp; Japanese.

The invention relates to a novel enterohaemorragic Escherichia coli 0157:H7-specific nucleic acid molecule. A polynucleotide of the invention has anti-bacterial activity. The polypeptide can be used in detection and/or treatment of 0157:H7 infection. The nucleotide sequence of the genome of Enterohaemorragic E coli 0157:H7 was determined. The present sequence represents an E. coli 0157:H7-specific polypeptide of the invention.

The invention also relates to the mutant verotoxin A subunit and the DNA encoding it; anticancer agents containing verotoxin A subunit and a ligand, especially troponin I, which binds to a cancer cell; a fusion gene encoding the mutant A subunit and verotoxin a subunit and vectors encoding the mutant A subunit/troponin I subunit, or the fusion gene encoding the mutant verotoxin A subunits, fusion proteins, and polymuciacides encoding the useful in the treatment of cancer. The present sequence represents the A subunit

This protein comprises the Escherichia coli phage H19B Shiga-like toxin.

UNA (see AAT91637) encoding the A subunit of the Shiga-like toxin was

UNA (see AAT91637) encoding the A subunit of the Shiga-like toxin was

UNA (see AAT91637) encoding the A subunit of the Shiga-like toxin was

UNA (SLTA-DTB'-LIZ) gene that was expressed in E. coli. The hybrid protein of

Can be isolated and used to treat conditions involving over-production of

Can be bearing ILZ receptors, such as certain T-cell lymphomas and organ

CC cells bearing ILZ receptors, resulting in cessation of protein synthesis and

CC death of target cells. Claimed hybrid proteins comprise a translocation

CC domain and a cell binding domain from e.g. a hormone, growth factor or

protein toxin. The hybrid molecules can be used for the delivery of

agents (e.g. therapeutic genes, toxins, detectable labels) into cells.

CC protein toxin. The hybrid molecules can be used for the delivery of

agents (e.g. therapeutic genes, toxins, detectable labels) into cells.

CC protein toxin relatively low doses, since a high proportion of the

cubecules can be manufactured as a single hybrid recombinant protein,

CC molecules can be manufactured as a single hybrid recombinant protein,

CC permitting reproducibility, consistency, and the precise control of

CC composition. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 17

The invention relates to antitoxin therapy for humans and other animals.

Antitoxins which neutralize the pathologic effects of Escherichia coli
coxins are generated by immunization of avian hosts with recombinant
coxins are generated by immunization of avian hosts with recombinant
coxins are generated by immunization of avian hosts with recombinant
coxins are generated by immunization of avian hosts with recombinant
coxins are generated by immunization of sequence. The VT is a fusion
protein comprising a non-verotoxin protein (especially an affinity tag)
complement of the VT-1 or VT-2 sequence. The VT B chains are
considered (i.e. polyhistidine). A polyhistidine affinity tag facilitates
ingle step affinity purification of subunits from periplasmic extracts.
However, due to poor recovery of his-tagged VT-1 A and VT-2 A chains,
conference control is necessary to permit cell viability. Bacterial host
colls expression of malcose binding protein (MBP) fused subunit, strict uninduced
promoter control is necessary to permit cell viability. Bacterial host
colls expressing a recombinant expression vector encoding a polyhistidine
affinity tag and a portion of the VT-2 B chain are claimed. The vector is
chosen from pgr14hisVT2BL. and pgr24ATSB, where "L"
cindicates that the vector encodes the mature form of the protein and
"L" indicates that the vector encodes the mature form of the protein and
"L" indicates that the vector encodes the mature form of the protein and
"L" indicates that the vector encodes the mature form of the protein
conferial cell is capable of expressing large quantities (40 mg/1) of
VT-2B. The toxins are useful for immunizing non-mammals and for detecting
conferial cannonemental samples including soil, water,
industrial samples, biological samples and samples obtained from detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bacterial cell for recombinantly expressing bacterial toxins in large quantities useful for immunization and treatment of bacterial infections, comprises expression vector encoding bacterial toxin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Compositions containing neutralising antitoxin against one or more E. coli verotoxin (VT) can be used to treat intoxicated adults and children with enteric bacterial infections. They may also be used as prophylactics e.g. as a vaccine, against diarrhoeal disease or the development of extra-intestinal complications of E.coli infection, especially haemolytic uraemic syndrome. The antitoxin can also be used to detect E. coli VT in a sample. The VT is recombinant, preferably a fusion protein containing a non-VT protein sequence and part of the E.coli VTI or VT2 sequence. This is a histidine tagged version of subunit A of VTI as expressed from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Compsn. contg. neutralising antitoxin against E.coli vero-toxin - used t
treat intoxicated individuals, and as a prophylactic against diarrhoeal
disease or extra-intestinal complications of E.coli infection.

Compositions containing neutralising antitoxin against one or more E. coli verotoxin (VT) can be used to treat intoxicated adults and children with enteric bacterial infections. They may also be used as prophylactics e.g. as a vaccine, against diarrhocal disease or the development of extra-intestinal complications of E.coli infection, especially haemolytic uraemic syndrome. The antitoxin can also be used to detect E. coli vr in a sample. The VT is recombinant, preferably a fusion protein containing a non-VT protein sequence and part of the E.coli VTI or VT2 sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a recombinant expression vector encoding an affinity tag and protein comprising at least a portion of a bacterial toxin consisting of Escherichia coli type 1 or type 2 vertoxin. The expression vector can be used to produce recombinant vertotoxin protein which can be used to create a vaccine against diseases caused by E. coli such as vertoxin haemorrhagic cystitis and balantitis. The antitoxins are useful for treating humans and animals intoxicated with a bacterial toxin, particularly E. coli vertocoxin. The antitoxins may also be used in the preventative treatment and in diagnostic assays to detect the correction at example. The polypeptides derived from E. coli vertocoxins are useful as immunogens for the production of vaccines, including multivalent vaccines and antitoxins, which can be administered to a subject at risk of diarrhoeal disease or at risk of developing extractinestinal complications of E. coli infections, e.g. haemolytic uremic syndrome, thrombocytopenic purpura. The present sequence represents the HIS tagged E.coli VTI-A verotoxin protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The rigg cay is received between the order in the pFlag-1 vector.

ECORI/Xhol A subunit PCR fragments were cloned into identically cleaved pragation to principle in the pragation of pragatic vector and synchronic protein contains the N-terminal 8 amino acid flag tag, for secretion of A subunit fusion proteins. After secretion the periplasmic protein contains the N-terminal 8 amino acid flag tag, followed by 4 vector-encoded amino acids fused to the recombinant A subunit. When B chains are small proteins (approximately 8 kba), so use of a small affinity tag was preferred (i.e. polyhistidine). A polyhistidine affinity tag facilitates single step affinity purification of subunits from periplasmic extracts. However, due to poor recovery of his-tagged vrome periplasmic extracts. However, due to poor recovery of his-tagged vrome periplasmic extression of MBP fused subunits was undertaken. Due to the toxicity of the VT-2 B subunit, strict uninduced promoter control is necessary to permit cell viability. Bacterial host cells expressing a recombinant expression vector encoding a polyhistidine affinity tag and a portion of the VT-2 B chain are claimed. The vector is chosen from prizythisyT2BL-, prizzthisyT2BL- and pBT24VT2B, where "L+" indicates that the vector encodes the proprien form of the protein and "L-" indicates that the vector encodes the mature form of the protein and "L-" indicates that the vector encodes the mature form of the protein and "L-" indicates that the vector encodes the mature form of the protein and bacterial cell is capable of expressing large quantities (40 mg/l) of VT-2B. The toxins are useful for immunizing non-mammals and for detecting bacterial samples, biological samples and samples obtained from protein and and protein and protein and protein samples, biological samples and samples obtained from from the protein and protein and protein and protein samples, biological samples and samples and samples obtained from from the protein and protein and protein and protein samples, biological sampl
                                                                                                                                                                                                                                                            Bacterial cell for recombinantly expressing bacterial toxins in large quantities useful for immunization and treatment of bacterial infections, comprises expression vector encoding bacterial toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           verotoxin (VT) types 1 and 2 subunit A were cloned into pFLAG-1

This invention relates to a recombinant expression vector encoding an affinity tag and protein comprising at least a portion of a bacterial coxin consisting of Escherichia coli type 1 or type 2 verocoxin. The expression vector can be used to produce recombinant verotoxin protein which can be used to create a vaccine against diseases caused by E. coli such as verotoxin haemorrhagic cystitis and balantitis. The antitoxins are useful for treating humans and animals intoxicated with a bacterial coxin, particularly E. coli verotoxin. The antitoxins may also be used in the preventative treatment and in diagnostic assays to detect the treatment are useful as immunogens for the production of vaccines. Correctoxins are useful as immunogens for the production of vaccines, including multivalent vaccines and antitoxins, which can be administered to a subject at risk of diarrhoeal disease or at risk of developing extractines. Incomplications of E. coli infections, e.g. haemolytic uremic syndrome, thrombotic thrombocytopenic purpura. The present sequence represents the Flag-tag/VTI fusion protein of the invention. This fusion protein of the recombinant New recombinant expression vector encoding affinity tag and Escherichia coli type 1 or type 2 verotoxin, useful for treating or preventing diseases due to E. coli verotoxins and in producing vaccines.                                                                                                                                                                   Lusion protein and is suitable for introduction into a bacterial host.

It were to comprises: (a) DNA encoding at least one cationic
bactericidal/permeability increasing peptide (BPI), (b) DNA encoding at least one cationic
carrier protein, and (c) DNA encoding an amino acid (aa) cleavage site
carrier protein, and (c) DNA encoding an amino acid (aa) cleavage site
coarrier protein, and (b) The present sequence represents the protein
from the pING3793 vector construct which codes for a BPI fusion protein.
The peptides have many uses including the treatment of bacterial and
cumpal infections. BPI peptides also bind to endotoxins and heparin,
neutralising their effects. The peptides have further been shown to
inhibit anglogenesis (partly due to heparin-binding activity). The fusion
proteins have been found to be expressed in large amounts without
significant proteolysis, and in some cases are actually secreted from the
chost cells. This allows the indirect production of anti-microbial BPI
                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                   Recombinant production of bactericidal/permeability increasing protein -
by expression as a fusion protein in microbial host cells, then cleaving
the BPI peptide from the carrier.

(A) derived from a steroid or polypeptide hormone, a single-chain analogue of a monoclonal antibody able to bind an antigen expressed on the cell surface, or a polypeptide toxin. (B) is derived from a toxin (e.g. diphtheria toxin or Pseudomonas exotoxin (A) may be derived from insulin, interleukins 2, 3 or 6 or epidermal growth factor. Suitable enzymes in (C) include cholera toxin, ricin, tetanus toxin,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               hexosamininidase A, protease, muclease, SLT-A, etc. Specified examples are CT-A/DT-B'/IL-2, SLTA/DT-B'/IL-2, HIVP-BP/DT-B'/IL-2, and the phenylalanine hydroxylase-DT-B' or their biologically active mutants. (GT-A= cholera toxin, DT-B' = truncated diphtheria toxin, SLTA= Shiga-like toxin A, HIVP-BP= HIV protease binding protein. See also AAQ12710-12. (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Recombinant, hybrid; binding domain; ligand; animal cell; diphtheria; translocation domain, botulinum; neurotoxin; ricin; cholera; tetanus; shiga-like toxin; pertussis; translocation; cytoplasmic membrane; HIV; cytosol; therapy; genetic deficiency disease; enzyme; co-factor; poison; adipocyte; cancer; virus; infection; antibody.

The intring your not a certification of a naturally occurring protein to bind to an animal cell; (b) the second part comprises a portion of a translocation domain of a naturally occurring protein to coxin, and phtherial toxin, botulinum neurotoxin, richi, cholera toxin, LT toxin, Ghiga-like toxin, pertussis toxin and tetanus toxin, which translocate the third part of the across the cytoplasmic membrane into the cytosol of the cell; and (c) the third part comprises a polypeptide entity to be introduced into the cell, which is non-native to the naturally occurring protein of (b). This sequence represents the E.coli bacteriophage H19B Shiga-like toxin A subunit sequence for use in generating the hybrid of the invention. The hybrid molecule enables the direction of appropriate therapy to affected cells, allowing them to function properly and alleviate or cure the disease. The hybrid is affected cells an enzyme supplying the missing function, to supplementing cellular levels of a particular enzyme or a scarce precursor or cofactor, to directing toxins or other poisons to destroy particular cells (such as adjocytes, cancer cell, or virus infected-cells), to counteracting viral infections such as HIV, by introducing appropriate antibodies to viral cinfections such as detected believed on 17-OCT-2003
                                                                                                                                                                                                                                                                                                                                                                                                                  invention relates to a recombinant DNA molecule encoding a hybrid cein comprising three parts: (a) the first part comprises a portion of binding domain of a cell-binding polypeptide ligand allowing the
                                                                                                                                                                                                                                                                                                       Recombinant DNA molecule encoding a three part hybrid protein used in the treatment of Aids and genetic deficiency diseases.
                                                                                                                                                                                                                                                                                                                                                                         Example 3; Fig 8; 31pp; English

New two-part hybrid protein comprising a translocation domain and a cell-binding domain, for treating genetic deficiency diseases, cancer and HIV infections

Example 3; Fig 8; 32pp; English.

This sequence represents the bacteriophage H19B shiga-like toxin protein sequence. The toxin can be included in the hybrid protein of the sequence. The toxin can be included in the hybrid protein of the hybrid protein comprises a first part which is a portion of the binding domain of a cell-binding ligand, effective to cause the hybrid molecule to bind to a cell-binding ligand, effective to cause the hybrid molecule to bind to a cell-binding ligand, effective to cause the hybrid molecule to bind to a cell-binding ligand, effective to cause the hybrid molecule to bind to a cell-binding ligand, effective to portion of a translocation domain of diphtheria toxin) the second part comprises a chemical entity to be introduced into the cell. The third part comprises a chemical entity to be introduced into the cell, where each of the first and third part is nonnative with respect to naturally occurring protein, and the covalent bond attaching the second and third part is cleavable. The toxin represented by the present sequence can form part of the third portion of the hybrid contein. The cell binding domain binds to a specific cell and the protein. The cell binding domain binds to a specific cell and the correst to the cytosel. The third part of the protein, linked to the translocation domain through a cleavable bond, can then carry out its function. The hybrid molecules are useful for treating genetic deficiency diseases by delivering to affected cells an enzyme supplying the missing function, to supplement cellular levels of a particular enzyme or a carce precursor or cofactor, to direct toxins or other poisons to infected cells, and to counteract viral infections such as HIV by infected colls, on 06-AUG-2003 to correct OS field.)

MBPNVT1-A fusion protein #2.

(first entry)

05-JUN-2002

```
Gesigned to allow expression of the native proteins as C-terminal fusions to a periphasmically-secreted version of maltose binding protein (WBP).

To a periphasmically-secreted version of maltose binding protein (WBP).

To a periphasmically-secreted version of maltose binding protein (WBP).

To the chains are small proteins (approximately 8 kDa), so use of a small affinity tag was preferred (i.e. polyhistidine). A polyhistidine affinity tag facilitates single step affinity purification of submits from periphasmic extracts. However, due to poor recovery of his-tagged VT-1 A and VT-2 A chains, expression of MBP fused submits was undertaken. Due to the toxicity of the VT-2 B submit, strict uninduced promoter control is necessary to permit call viability. Bacterial host calls expressing a recombinant expression vector encoding a polyhistidine affinity tag and a portion of the VT-2 B chain are claimed. The vector is chosen from periodes the preprotein form of the protein and "L-" indicates that the vector encodes the mature form of the protein and "L-" indicates that the vector encodes the mature form of the protein and "L-" indicates that the vector encodes the mature form of the protein The bacterial call is capable of expressing large quantities (40 mg/l) of VT-2B. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bacterial cell for recombinantly expressing bacterial toxins in large quantities useful for immunization and treatment of bacterial infections, comprises expression vector encoding bacterial toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             toxins are useful for immunizing non-mammals and for detecting bacterial toxins in environmental samples including soil, water, industrial samples and samples obtained from food and dairy

This invention relates to a recombinant expression vector encoding an affinity tag and protein comprising at least a portion of a bacterial toxin consisting of Escherichia coli type 1 or type 2 verotoxin. The expression vector can be used to produce recombinant verotoxin protein which can be used to create a vaccine against diseases caused by E. coli such as verotoxin haemorrhagic cystitis and balantitis. The antitoxins are useful for treating humans and animals intoxicated with a bacterial toxin, particularly E. coli verotoxin. The antitoxins may also be used in the preventative treatment and in diagnostic assays to detect the preventative treatment and in diagnostic assays to detect the presence of a toxin in a sample. The polypeptides derived from E. coli verotoxins are useful as immunogens for the production of vaccines, verotoxins may also be used in considerable manual disease or at risk of developing extracting multivadent vaccines and antitoxins, which can be administered to a subject at risk of diarrhoeal disease or at risk of developing extractines in the mombalic thrombocytopenic purpura. The present sequence represents the MBPNVT1-A protein #2 of the invention. This fusion protein associated to facilitate purification of the recombinant proteins of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New recombinant expression vector encoding affinity tag and Escherichia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Compositions containing neutralising antitoxin against one or more E. coli verotoxin (VT) can be used to treat intoxicated adults and children with enteric bacterial infections. They may also be used as prophylactics e.g. as a vaccine, against diarrhoeal disease or the development of extra-intestinal complications of E.coli infection, especially haemolytic uraemic syndrome. The antitoxin can also be used to detect E. coli VT in a sample. The VT is recombinant, preferably a fusion protein containing a non-VT protein sequence and part of the E.coli VTI or VT2 sequence. This is a maltose binding protein/VTI A subunit fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                   Compsn. contg. neutralising antitoxin against E.coli vero-toxin - used to treat intoxicated individuals, and as a prophylactic against diarrhoeal disease or extra-intestinal complications of E.coli infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    VT-1; verotoxin; antitoxin therapy, fusion protein; affinity tag; food, recombinant production; screening; dairy; anti-bacterial; vaccine; primer; maltose binding protein; MBP.

Gesigned to allow expression of the native proteins as C-terminal fusions designed to allow expression of the native proteins as C-terminal fusions to a periplaamically-secreted version of maltose binding protein (MBP).

The vector contains an engineered factor Xa cleavage site, which permits the removal of the affinity tag (i.e. MBP) from the fusion protein after purification. VT B chains are small proteins (approximately 8 kDa), so the of a small affinity tag was preferred (i.e. polyhistidine affinity tag and interest single step affinity purification of subunits from periplasmic extracts. However, due to poor recovery of his-tagged VT-1 A and VT-2 A chains, expression of MBP fused subunits was undertaken. Due to the toxicity of the VT-2 B subunit, strict uninduced promoter control is necessary to permit cell viability. Bacterial host cells expressing a recombinant expression vector encoding a polyhistidine cells expressing a recombinant expression vector encoding a polyhistidine chosen from pET24hisVT2BL- and pET24VT2B, where "L+" indicates that the vector encodes the mature form of the protein and "L-" indicates that the vector encodes the mature form of the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              bacterial toxins in environmental samples including soil, water, industrial samples, biological samples and samples obtained from food and
                                                                                                                                                                                                                                                                                                                                                                                                                                    Bacterial cell for recombinantly expressing bacterial toxins in large quantities useful for immunization and treatment of bacterial infections, comprises expression vector encoding bacterial toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The bacterial cell is capable of expressing large quantities (40\ \text{mg/l}) of VT-2B. The toxins are useful for immunizing non-mammals and for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Verotoxin; VT2-A; antitoxin; antidiarrheal; antibacterial; haemostatic; vaccine; haemorrhagic cystitis; balantitis; MBPNVT1-A; haemotytic uremic syndrome; thrombotic thrombocytopenic purpura.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               US-09-136-1389-2

US-09-136-1389-2

Sequence 2, Application US/09136389

Patent No. 6146850

GENERAL INFORMATION:
APPLICANT: Better, Marc D.
APPLICANT: Studmika, Gary M.
TITLE OF INVENTION: Immunocoxins Comprising Ribosome-Inactivating
TITLE OF INVENTION: Proteins
NUMBER OF SEQUENCES: 173

CORRESPONDENCE ADDRESS:
ADDRESSEE: MACANdrews, Held & Malloy, Ltd.
STREET: 500 West Madison Street, 34th floor
CITY: Chicago
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 GLDTVSFSTKGATYITYVNFLNELRVKLKPEGNSHGIPLLRKKCDDPGKCFVLVALSNDN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 2, Application US/07901707

Patent No. 5376546

GENERAL INFORMATION:
APPLICANT: Bernhard, Susan L.
APPLICANT: Carroll, Steve F.
APPLICANT: Lane, Julie A.
TITLE OF INVENTION: Materials Comprising and Methods of
TITLE OF INVENTION: Composition and Use for Ribosome-Inactivating Proteins

"Trichosanthes kirilowii trichosanthin (TCS) mature peptide gene.";
submitted (UNN-2004) to the EMBL/GenBank/DDBJ databases.
-!-CATALYITC ACTIVIT: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rRNA.
-!-SIMILARITY: Belongs to the ribosome-inactivating protein family.

Cloning and expression of three abrin A-chains and their mutants derived by site-specific mutagenesis in Escherichia coli.";
Eur. J. Blochem. 219:83-87(1994).
-!- CATALYITC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S TRNA.
-!- SIMILARITY: Belongs to the zibosome-inactivating protein family.
--- SIMILARITY: CAA54139.1; -.
HSSP: P11140; JABR.
GQ: GO:0016787; F:hydrolase activity; IEA.

Lin Y., Wu Z.J., Lin Q.Y., Xie L.H.;
Submitted (JUL-2002) to the EMBL/GenBank/DDBJ databases.
-!- CATALYIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rRNA.
-!- SIMILARITY: Belongs to the ribosome-inactivating protein family.
